

# Oriental Cockroaches

## QUICK STATS:

**Color:** Shiny Black

**Shape:** Oval

**Size:** 1 inches long

## OVERVIEW

Oriental cockroaches live in sewers and in wet, decaying organic matter. They are sometimes called “waterbugs” because they come out of drains, and “black beetle cockroaches” because of their smooth, dark bodies.

## HABITS

Oriental cockroaches can survive quite well outdoors, where they can be found under debris, leaves, stones and porches or in wall voids.

They can enter homes through door thresholds, under sliding glass doors, along utility pipes and air ducts and from floor drains.

Inside homes, Oriental cockroaches tend to hide in crawl spaces, basements and around utility pipes. Oriental cockroaches feed on all kinds of food, especially decaying organic matter and starchy foods.

## THREATS

Cockroaches have been reported to spread at least 33 kinds of bacteria, six kinds of parasitic worms and at least seven other kinds of human pathogens. Oriental cockroaches’ habit of feeding on filth means that they are likely to pick up germs on the spines of their legs and bodies as they crawl through decaying matter or sewage and then carry these onto food or food surfaces

## PREVENTION

- Keep food sealed and stored properly particularly in kitchens.
- Clean kitchens daily, where crumbs and trash are more likely to build up.
- Dispose of garbage regularly and store in sealed containers.
- Seal cracks and holes in homes, including entry points for utilities and pipes.
- Keep basements and crawl spaces well ventilated and dry.
- Contact a qualified pest professional to treat any infestations.

## DID YOU KNOW? Oriental Cockroaches

- are believed to be of North African origin, despite their name.
- can survive outdoors in freezing temperatures for long periods of time.
- are known for their strong, unpleasant, “roachy” odor.
